

Instructions – Experiment 6

This experiment is very similar to the one before. There is only one change:

- As before, spring water producer 1 decides first about how many bottles to produce. Then producer 2 is informed about this choice and decides about his number of bottles.
- However, in this experiment, at the very same time when the producer 2 decides after having seen producer 1's choice, **producer 1 simultaneously** (i.e., without seeing producer 2's choice) **can reconsider her choice**. Specifically, she can change her choice to any other number of bottles to produce, or stay with her choice. So, Producer 1 **will not see Producer 2's choice** when revising her choice, and Producer 2 **will not be able to observe Producer 1's change**.

All the other setup is exactly the **same**: please refer to the old instructions for the details. However, you may have a different role compared to the experiment before: either producer 1 or producer 2. This experiment will go over 3 rounds.

Any questions?
